

# Predicting Fertility Rates in the United States

ISABELLA M., MAIA P., ELIZA G., PETER P.

**We chose to examine  
15 predictors  
across 5 categories  
for 5 years (2018-2022).**

**US Census + the ARDA + Cook Political + Law Atlas  
[15x250]**

RELIGIOUSNESS RATE

COVID YEAR

% WHITE

% BLACK

% HISPANIC

% ASIAN

% MIXED RACE

% FOREIGN BORN

POVERTY MEASURE

% HIGH SCHOOL OR SOME COLLEGE

% LESS THAN HIGH SCHOOL

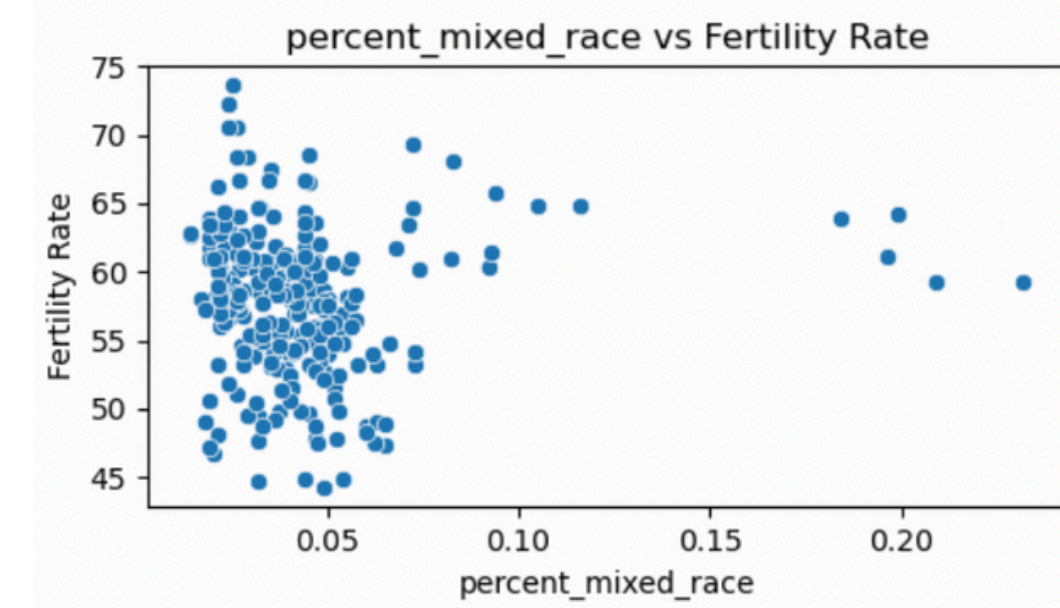

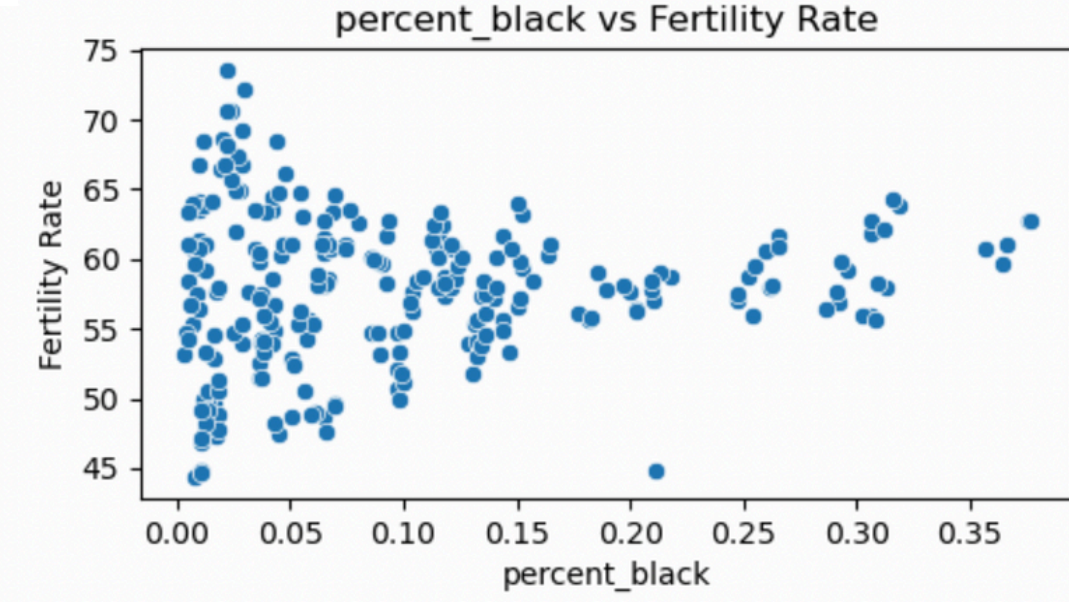

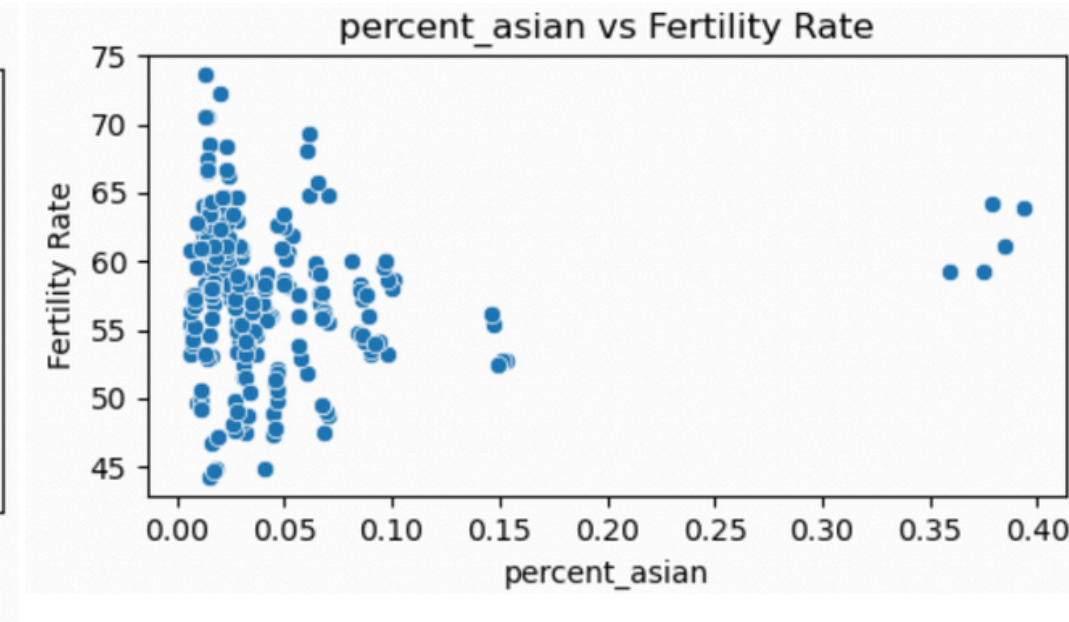

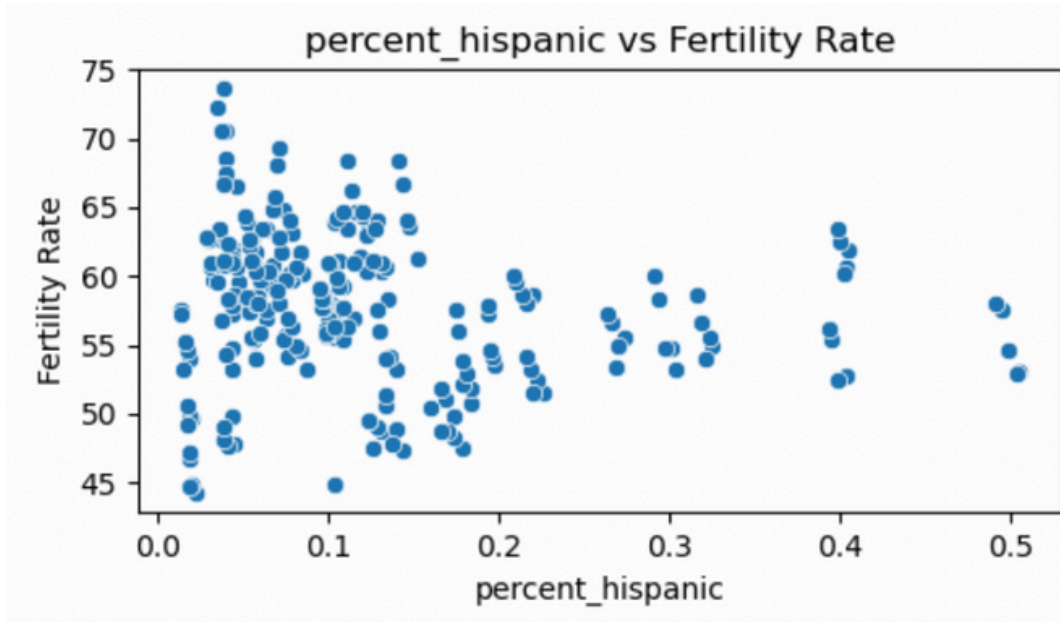

% BACHELORS OR HIGHER

POLITICAL RANKING

LATES ABORTION

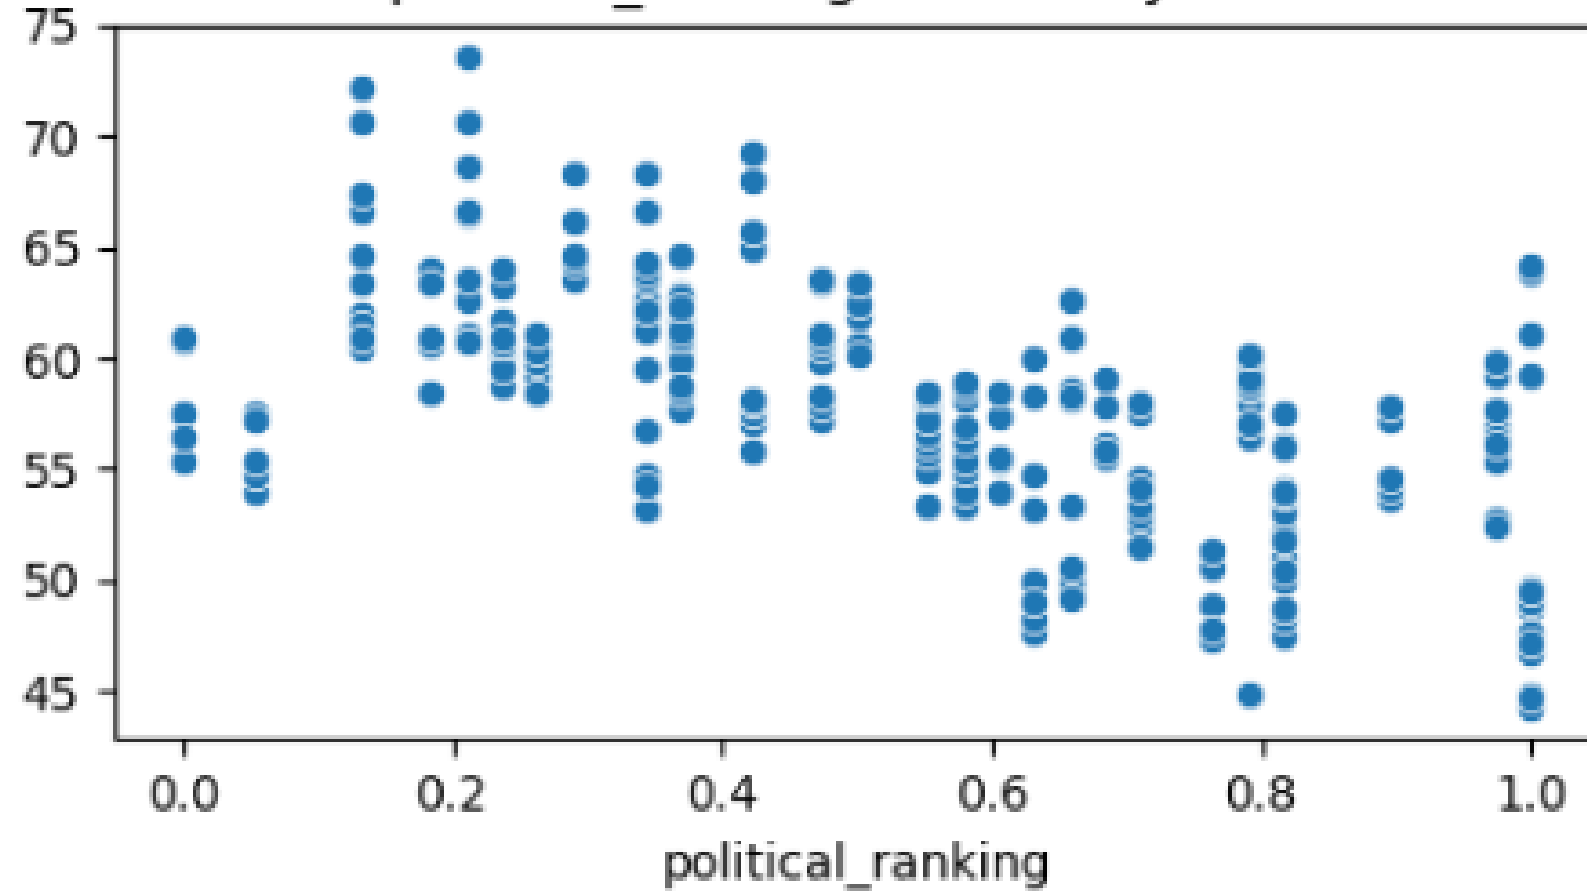

NO ABORTION LAW

**Diversity-related variables show clustering patterns influenced by contextual factors.**

political\_ranking vs Fertility Rate

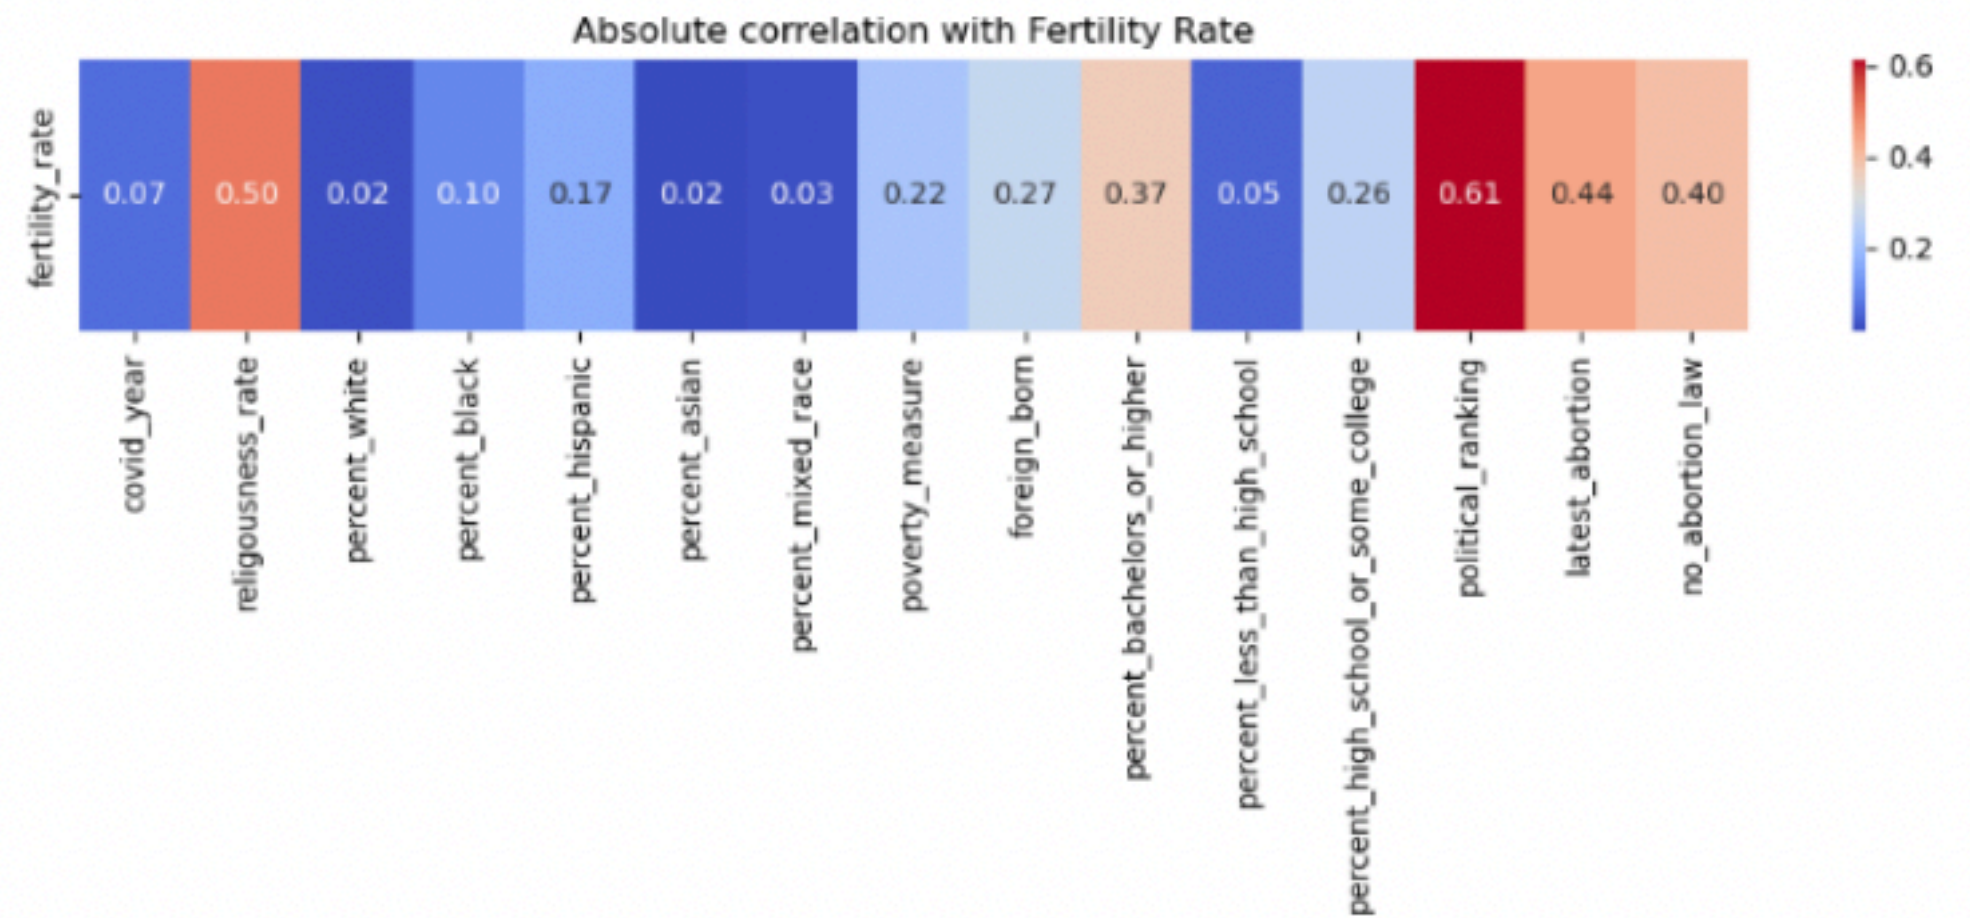

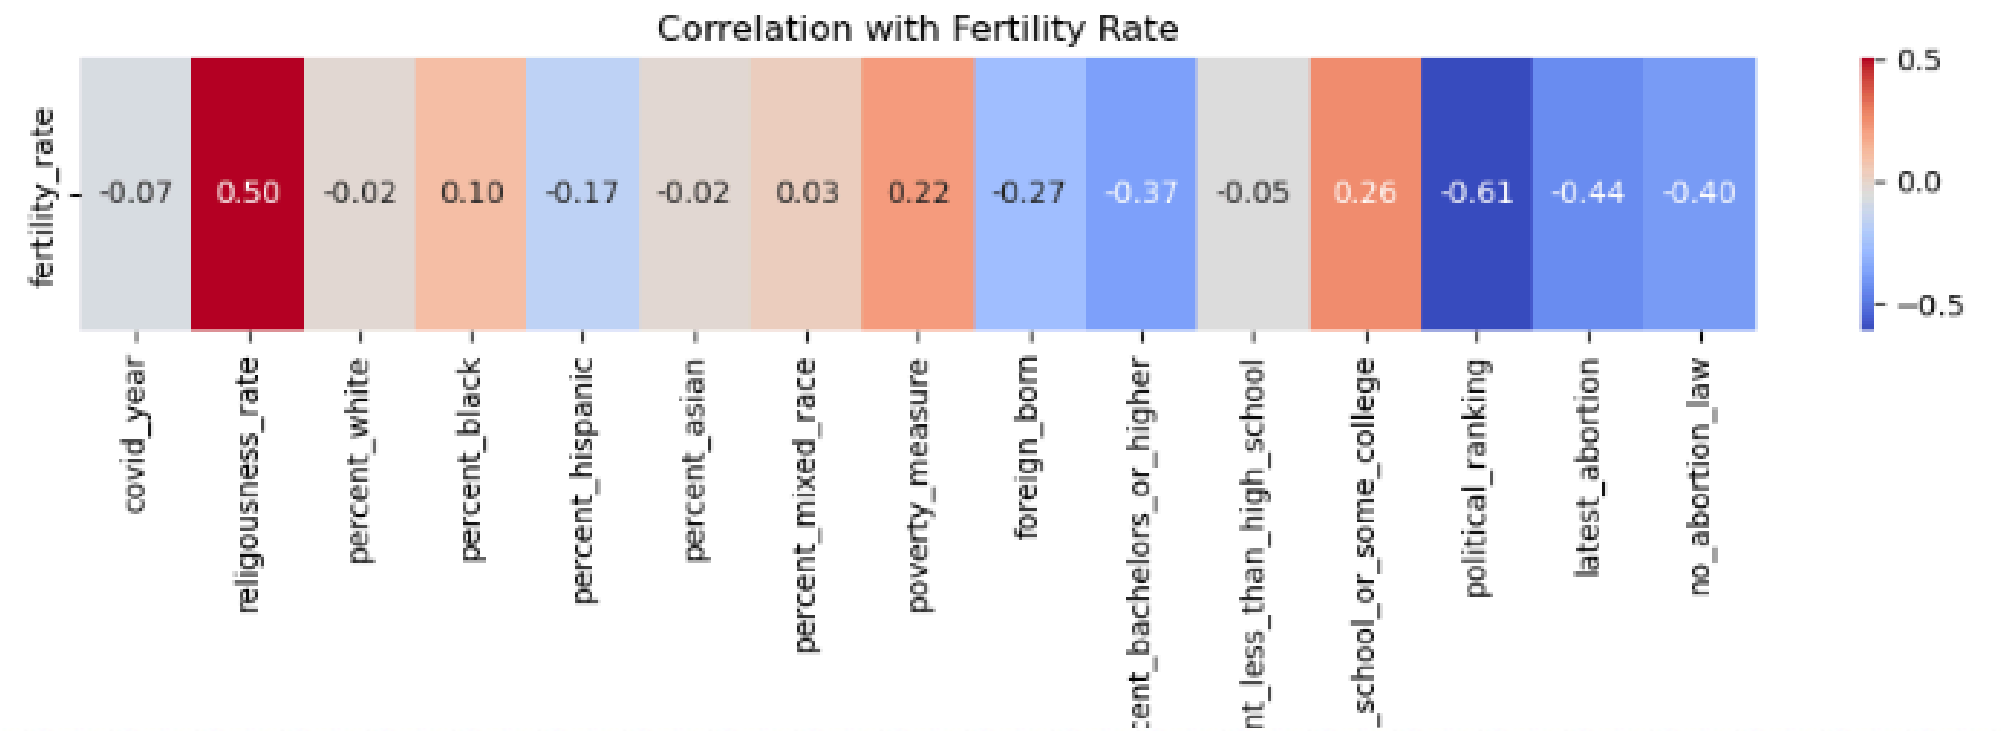

poverty\_measure vs Fertility Rate

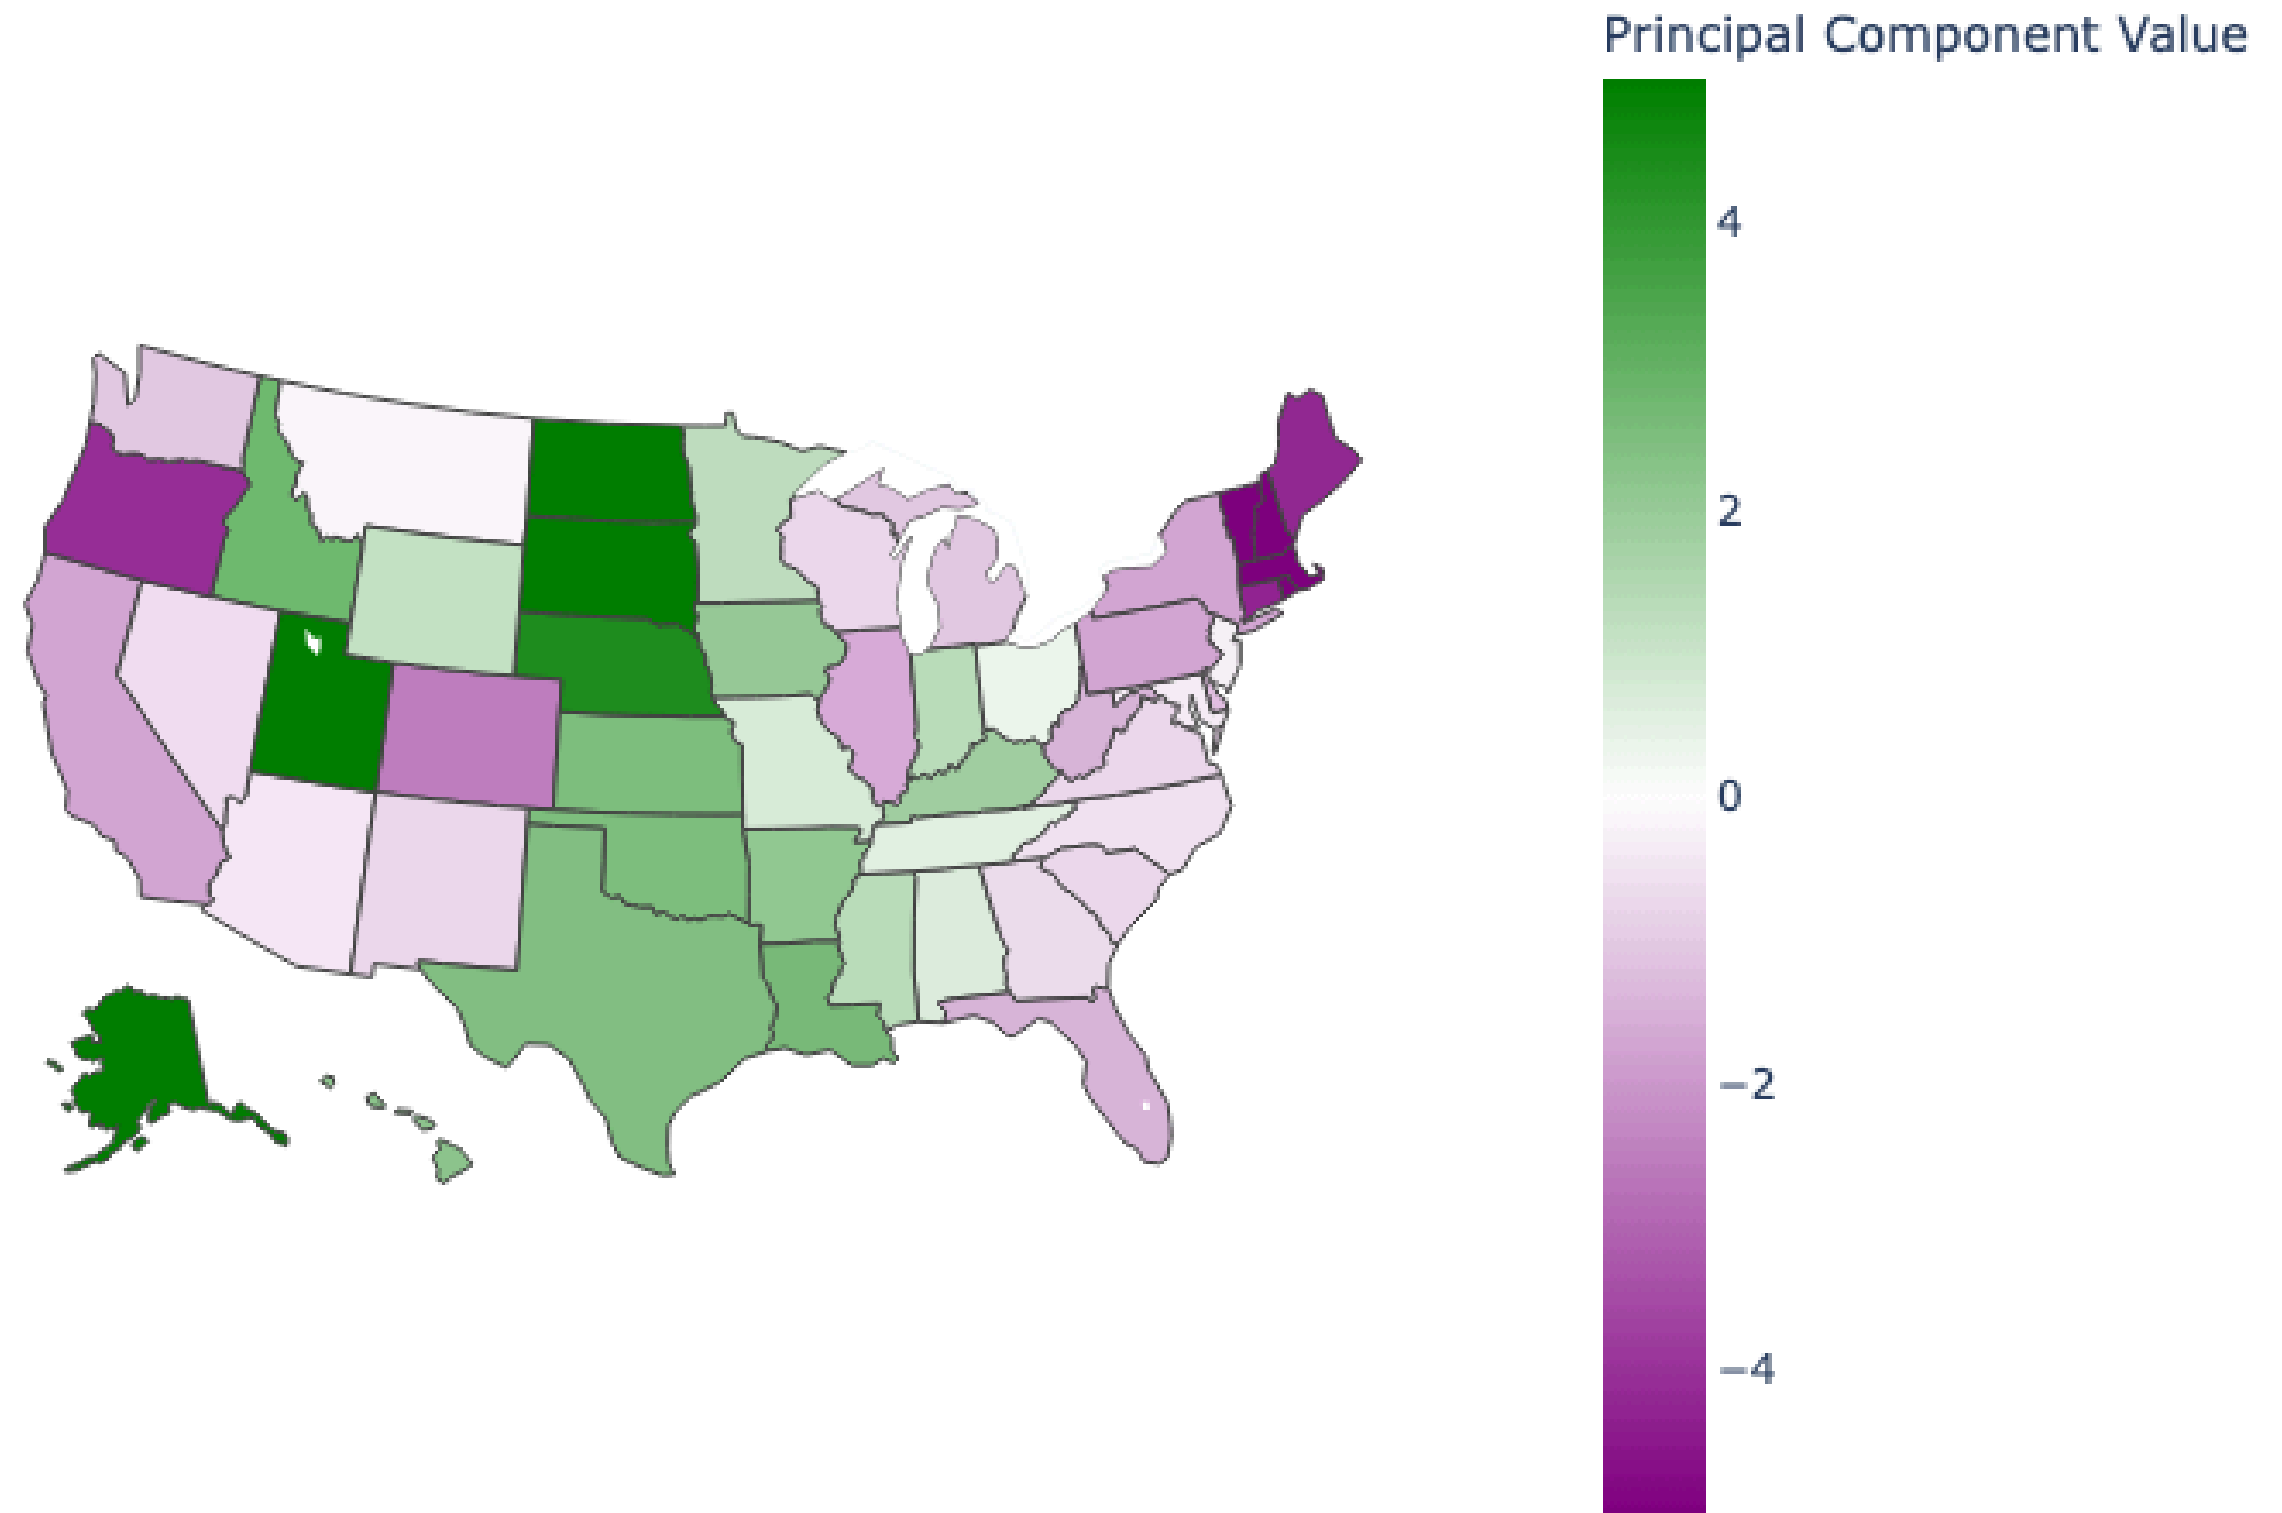

**Certain relationships, such as political ranking vs. fertility rate, exhibit linear patterns.**

# Which predictors correlate with fertility rate most strongly?

**How does the  
fertility rate vary  
across states?**  
(94% variance)

**Interaction effects likely play  
a significant role in  
determining fertility rates.**

Cross Validation on 5 Folds

# Model 1: Linear Regression with Interaction Terms

CV Mean MSE: 0.946

R<sup>2</sup> CV Mean: -0.149

we only care about  
certain predictors

**We decided to use  
lasso and cross  
validation to  
identify specific  
predictors.**

0.1 second

Cross Validation on 5 Folds and StandardScaler

## Model 2: Lasso Regression with Interaction Terms

CV Mean MSE: 0.147

R2 CV Mean: 0.829

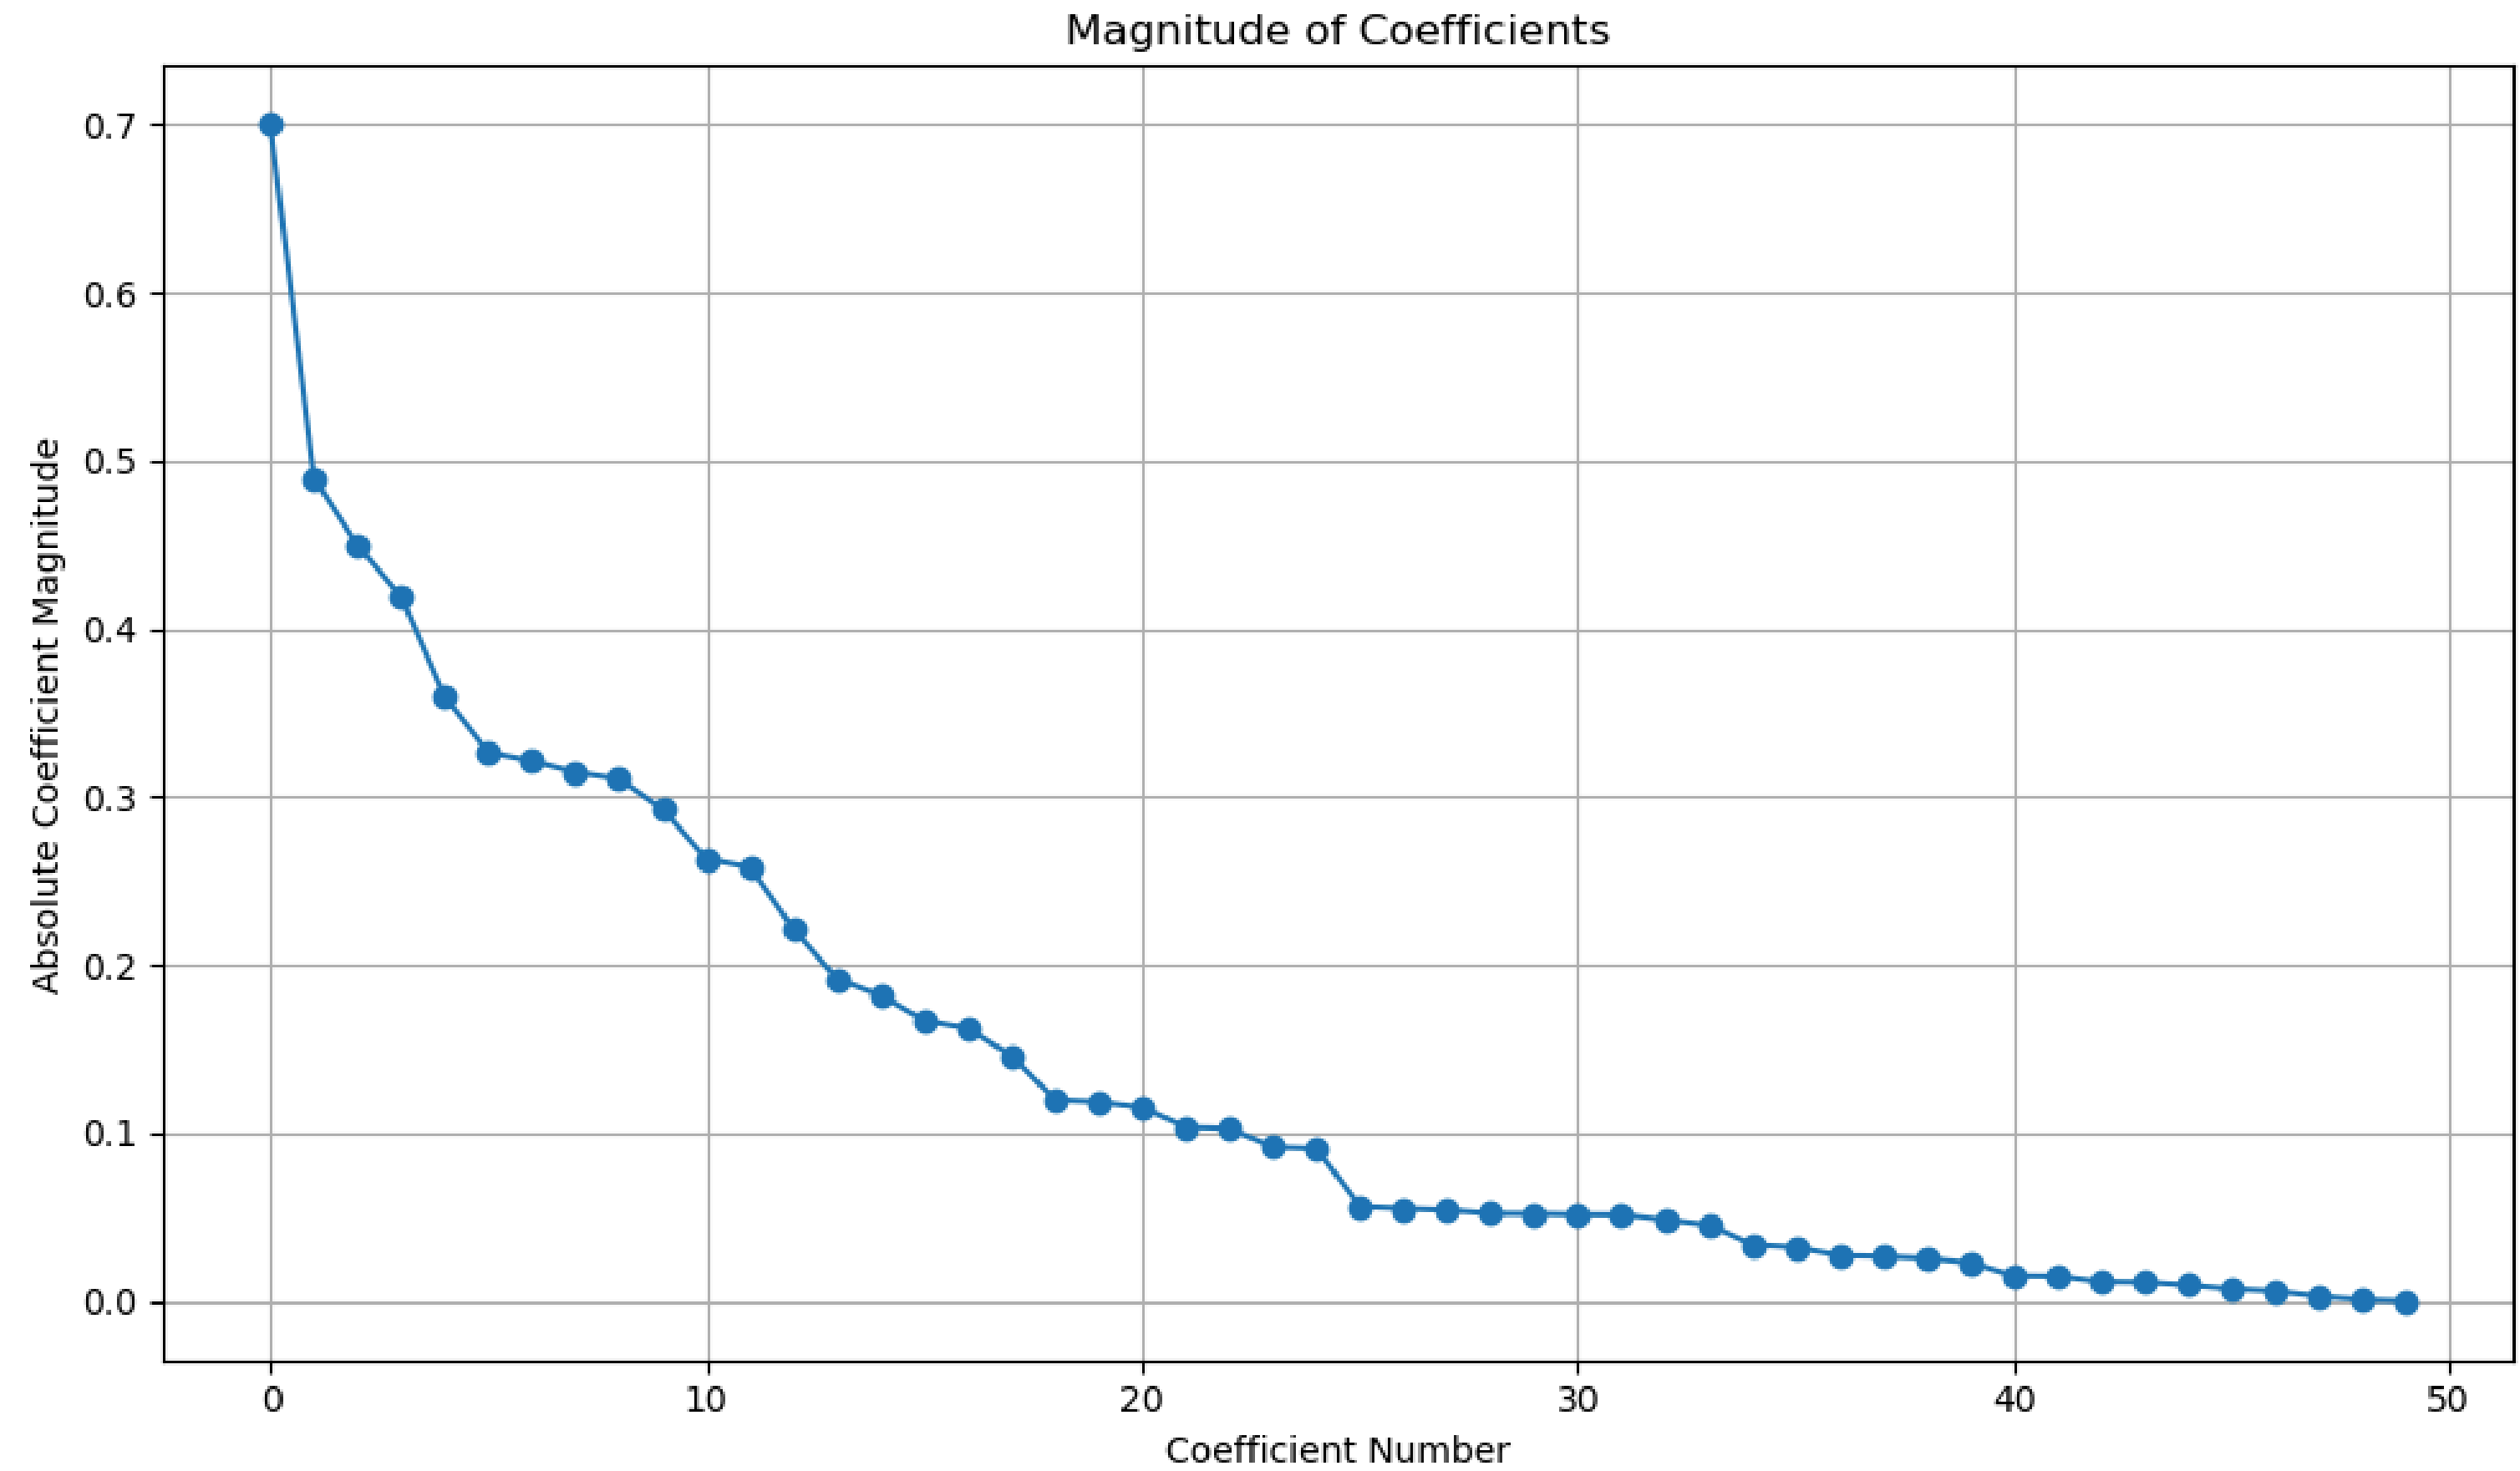

TEST MSE: 0.115  
R2 MSE: 0.888

**Both the MSE and  
R2 values, are  
similarly good,  
implying that the  
model is robust.**

2.3 seconds

Features

**Two of the top five predictors are interaction terms: percent Black x poverty and political leaning x poverty**

**Of the 50 significant predictors, predictive powers concentrated in the top 24.**

**Political Ranking**

**% Mixed Race**

**% Asian**

**Poverty Measure x Political Ranking**

**% Black x Political Ranking**

**% Bachelors or higher percent high school or some college**

**% Asian x Poverty Measure**

**% Less than high school X % Percent high school or some college**

**Poverty measure X % high school or some college**

**Religiousness Rate X % White**

**% White X Political Ranking**

**% Hispanic X % Bachelors or Higher**

**Foreign Born X No Abortion Law**

**Religiousness Rate X Political Ranking**

**% Mixed Race X % Less than High School**

**Religiousness Rate X Poverty Measure**

**Poverty Measure**

**Religiousness Rate X % Less than High School**

**Political Rank X No Abortion Law**

**Religiousness Rate X % Black**

Focused on top 24 Predictors

# **Model 3: Causal Inference Analysis**

Linear Regression, MinMax scaler,  
Propensity Score weighted Ordinary Least Squares

# AREAS FOR IMPROVEMENT

While examining things on the state level was useful, we would use additional time to look at the county or zip-code level.

Our dataset is limited in size, both in number of observations (rows) and number of predictors (columns).

This scarcity of predictors may mean we are missing out on significant confounding variables, important for causal inference.
